TEST COMMENTS:

This location was planted in a bit of dry soil conditions but started getting plenty of rain afterwards. At the time of stand counts, emergence was uniform but a little on the thin side, likely due to heavily saturated soils shortly after planting. June gave 11.7 inches of rain at this location, followed by nothing in July, with very hot temps and drought-like conditions putting this plot into a stressed pollination period. A life-saving rain in August helped this area avoid complete disaster and allowed the hybrids to finish out as well as possible. However, the damage was already done, as seen by the lower yields in this area.
